

DLT – Delta Live Tables

Introduction to DLT

DLT End to End Scenario

DLT Scenario Data Setup

Create DLT Workload using SQL

Create and run DLT Pipeline

Create DLT Workload using Python

Databricks Cloud

Databricks Delta Live Table

What is Databricks Delta Live Table (DLT)

DLT is a framework for building data processing pipelines

We use this framework in two steps.

1. Write Declarative pipeline code
2. Create a DLT pipeline using Databricks Workflow UI

Declarative ETL Tool

ETL Pipeline – How

Write code for how to do

1. How to extract data from a given source system.
2. How to transform or validate data after extracting.
3. How to load valid and invalid data after transforming.

Stitch tasks together using orchestration tools

Declarative ETL – What

Define what to do

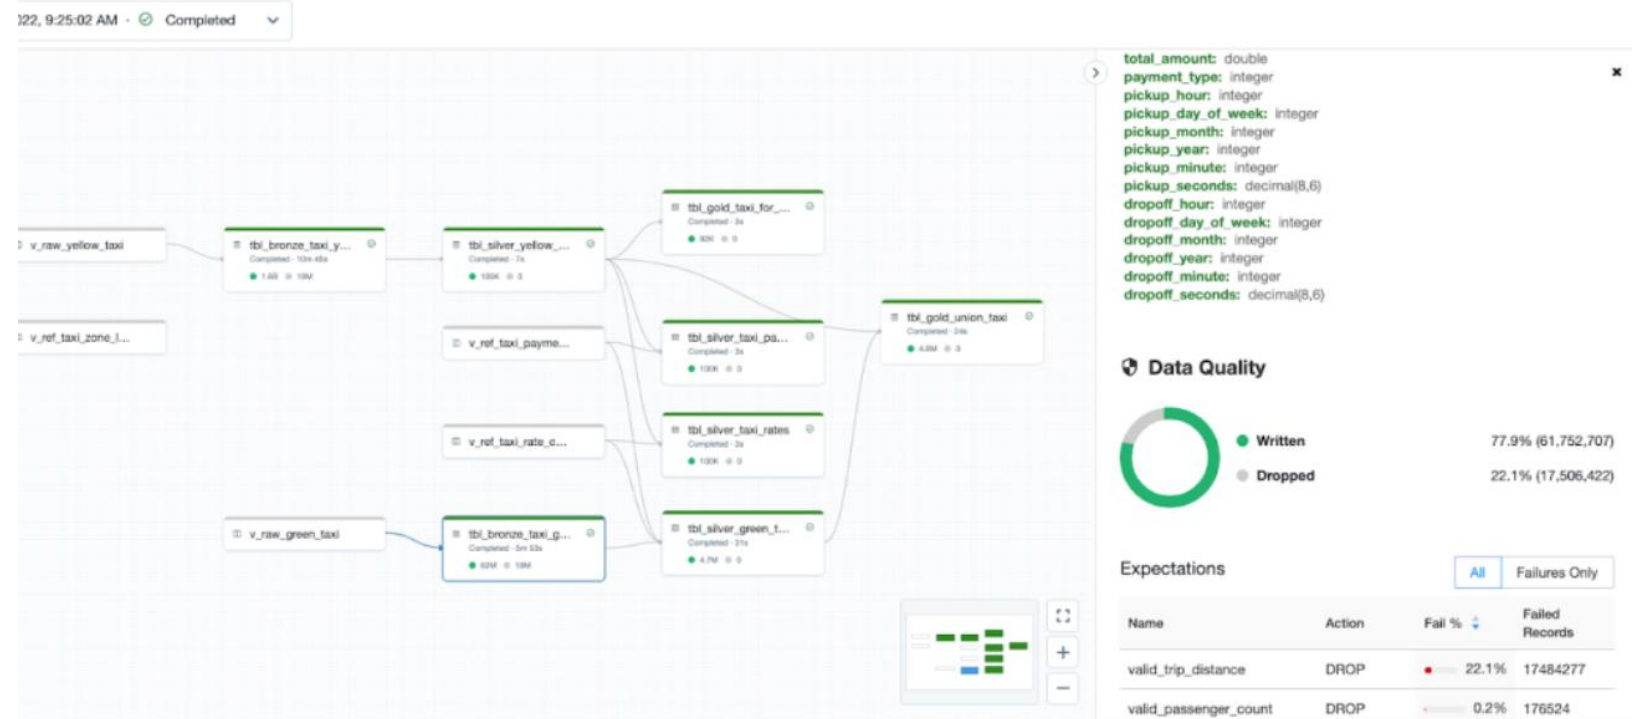

1. What to extract from the given source
2. What are your data quality expectations
3. What actions to take when expectations are met
4. What actions to take when expectations are not met

Integrated orchestration

Define what to do

1. What to extract from the given source
2. What are your data quality expectations
3. What actions to take when expectations are met
4. What actions to take when expectations are not met

a Live Tables SQL Pipeline
